"Developmental and growth temperature regulation of two different
microsomal omega-6 desaturase genes in soybeans:";
plant physiol. 110:311-319(1996).
-I- FUNCTION: ER (MICROSOMAL) OMEGA-6 FATTY ACID DESATURASE INTRODUCES
THE SECOND DOUBLEBOND IN THE BIGSYNTHESIS OF 18:3 FATTY ACIDS,
IMPORTANT CONSTITUENTS OF PLANT MEMBRANES. IT IS THOUGHT TO USE
CYTOCHROME B5 AS AN ELECTRON DONOR AND TO ACT ON FATTY ACIDS
ESTERIFIED TO PHOSPHATIDYLCHOLINE AND, POSSIBLY, OTHER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 01-FEB-1996 (Rel. 33, Created)

Cooke R., Laudie M., Raynal M., Delseny M.;
Cooke R., Laudie M., Raynal M., Delseny M.;
Submitted (MAR-1996) to the EMBL/GenBank/DDBJ databases.
-I- FUNCTION: Membrane bound hemoprotein which function as an electron carrier for several membrane bound oxygenases (By similarity).
-I- SUBCELLULIAR LOCATION: MICROSOMAL MEMBRANE. BOUND TO THE
CYTOPLASMIC SIDE OF THE ENDOPLASMIC RETICULUM (BY SIMILARITY).
-I- SIMILARITY: BELONGS TO THE CYTOCHROME B5 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Q42342; Q9SB05;

"Expression of a borage desaturase cDNA containing an N-terminal cytochrome b5 domain results in the accumulation of high levels of delta6-desaturated fatty acids in transgenic tobacco.";
Proc. Natl. Acad. Sci. U.S.A. 94:4211-4216(1997).
-1- FUNCTION: Membrane bound hemoprotein which function as an electron carrier for several membrane bound oxygenases (By similarity).
-1- SUBCELLULAR LOCATION: MICROSOMAL MEMBRANE. BOUND TO THE CYTOCHROME B5 FAMILY.
-1- SIMILARITY: BELONGS TO THE CYTOCHROME B5 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16-OCT-2001

IS INVOLVED IN THE REDUCTION OF CYTOCHROME P-450 AND MAY THEREFORE BE INVOLVED IN FLAVONOID BIOSYNTHESIS IN THE PETALS. SUBCELLULAR LOCATION: MICROSOMAL MEMBRANE. BOUND TO THE CYTOPLASMIC SIDE OF THE ENDOPLASMIC RETICULM( BY SIMILARITY). TISSUE SPECIFICITY: IS HIGHLY EXPRESSED IN DEVELOPING SEEDS, MODERATELY EXPRESSED IN FLOWERS, AND IS EXPRESSED AT LOW LEVELS IN THE LEAP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SIMILARITY: BELONGS TO THE CYTOCHROME B5 FAMILY.

                                                                                                                                                    -!- FUNCTION: Nitrate reductase is a key enzyme involved in the fi
step of nitrate assimilation in plants, fungi and bacteria.
-!- CATALYTIC ACTIVITY: Nitrite + NAD(+) + H(2)O = nitrate + NADH.
-!- COFACTOR: REQUIRES FAD, A HEME GROUP (CALLED CYTOCHROME B-557)
                                                                                                                                                                                                                                                                                                              Phaseolus vulgaris (Kidney bean) (French bean).

Submitted (JUL-1994) to the EMBL/GenBank/DDBJ databases.

1- FUNCTION: Nitrate reductase is a key enzyme involved in the first
step of nitrate assimilation in plants, fungi and bacteria.

1- CATALYTIC ACTIVITY: Nitrite + NAD(+) + H(2)O = nitrate + NADH.

1- COFACTOR: REQUIRES FAD, A HEME GROUP (CALLED CYTOCHROME B-557)
                                                                                                                                                                                                                                                                                                                     LOTJA

Patent No. 597264

Patent No. 597264

Patent No. 5972664

Patent No. 5972664

Papplicant: KNUTZON, DEBORAH

APPLICANT: MURKERJI, PRADIP

APPLICANT: HUANG, YUNG-SHENG

APPLICANT: THURMOND, JENNIFER

APPLICANT: CHAUDHARY, SUNITA

TITLE OF INVENTION: METHODS AND COMPOSITIONS FOR SYNTHESIS

TITLE OF INVENTION: OF LONG CHAIN POLY-UNSATURATED FATTY ACIDS

NUMBER OF SEQUENCES: 12

CORRESPONDENCE ADDRESS:
ADDRESSE: RAE-VENTER LAW GROUP, P.C.
